

## **System Requirements and Recommendations**

Before installing RMDC software on your computer, review the operating system requirements and recommendations. For information on FMDC configuration and installation, contact your company's System Administrator.

RMDC runs on a .Net 2.0 Framework and transfers data to and from your computer via .Net 2.0 Remoting using XML over HTTP using a named port. For more information on .Net, refer to <http://www.microsoft.com/net>.

For optimal performance of RMDC, use the hardware, monitor, and internet connection recommended by Restaurant Magic.

### **Operating System Requirements**

- Microsoft Windows XP Home or Professional or Windows Vista.
- Microsoft .Net Framework, version 2.0.

### **Hardware Recommendations**

- RAM of 2 GB or greater.
- Processor speed of 2.2 GHz or faster.

### **Monitor Recommendations**

- Screen resolution of 1024 x 768 or higher. Resolution of 800 x 600 is supported, but is not optimal for viewing.

**Note:** *RMDC supports multiple monitor configurations. Restaurant Magic highly recommends dual monitors for desktops performing application administration or for any desktop that can support dual monitors. Restaurant Magic provides a multiple document interface (MDI) format allowing you to have multiple tasks and reports in view at the same time. When a dual monitor configuration is not possible, Restaurant Magic works very well in single monitor mode with a screen resolution of 1024 x 768 or higher.*

### **Internet Connection Recommendations**

- Internet speed of 128Kbps or higher and a full time network connection.

**Note:** *If using a dial-up network connection, you must dial in manually when you are ready to transmit data. RMDC does not start the dial-up connection automatically. A dial-up network connection is not recommended as a long-term solution.*

- Contact your company's System Administrator for information on antivirus and firewall requirements.
